1. Features

- Ultra Low Profile
- Tiny SMT (14mm x 21mm X 13mm) or DIL package (14mm x 21mm X 8mm)
- IEEE802.3af compliant
- Low cost
- Input voltage range 36V to 57V
- Minimal external components required
- Short-circuit protection
- Industrial temperature version available
- Over temperature protection (Industrial Temperature version- MT or LP)
- Adjustable Output
- 1500V isolation (input to output)
- Silvertel “design-in” assistance

2. Description

The Ag9900 Power-over-Ethernet (PoE) modules are the smallest POE solution in the world and designed to extract power from a conventional twisted pair Category 5 Ethernet cable, conforming to the IEEE 802.3af PoE standard.

The Ag9900 signature and control circuit provides the PoE compatibility signature required by the Power Sourcing Equipment (PSE) before applying up to 15W power to the port. The Ag9900 provides a Class 0 signature.

The DC/DC converter operates over a wide input voltage range and provides a regulated output. The DC/DC converter also has built-in short-circuit output protection.

Table 2: Pin Description
4. Functional Description

4.1 Inputs

The Ag9900 is compatible with equipment that uses Alternative A (power on data pair) or Alternative B (power on spare pair) options, see Figure 3. It is specified that the PSE does not apply power to both outputs at the same time (Refer to IEEE802.3af for more information).

![Typical System Diagram](image)

Figure 3: Typical System Diagram

4.2 PD Signature

When the Ag9900 is connected to the Cat5e cable, it will automatically present a Powered Device (PD) signature to the Power Sourcing Equipment (PSE) or Midspan Equipment, when requested. The equipment will then recognise that a powered device is connected to that line and supply power.

4.3 Isolation

To meet the safety isolation requirements of IEEE802.3af section 33.4.1 a Powered Device (PD) must pass the electrical strength test of IEC 60950 sub clause 6.2. This calls for either a) 1500Vac test or b) 1500Vdc impulse test. The Ag9900 is specified to meet the 1500Vdc impulse test. It is also important that the tracks on either side of the isolation barrier have at least a 3mm clearance, see Figures 12 & 14 for more information.
4.4 Power Classification

The Ag9900 is set to Class 0 (0.44 Watts to 12.95 Watts) operation.

4.5 DC/DC Converter

The Ag9900’s DC/DC converter provides a regulated output that has built-in short-circuit output protection – refer Table 1: Ordering information for voltage and power ratings.

4.6 Output Adjustment

The Ag9900 has an ADJ pin, which allows the output voltage to be increased or decreased from its nominal value. Figure 4: Output Adjustment shows how the ADJ pin is connected.

Table 3: Output Adjustment Resistor (R) Value
4.7 Typical Connections

The Ag9900 requires minimal external components as shown in Figure 5: Typical Connection Diagram.

C1 must be fitted for output stability and should be a minimum of 100µF. This capacitor should be positioned as close to the output pins as possible. C1 is also required to handle load step change and reduce the output ripple. For applications where the output needs to cope with high load step changes, or to reduce the output ripple we recommend using a low ESR electrolytic as this reduces the output ripple. Also a low ESR capacitor is essential for operation below 0°C.

BR1 and BR2 can be inexpensive bridge rectifiers, for example MB4S or MB6S.

![Figure 5: Typical Connection Diagram](image)

The output adjust input (ADJ) is optional, it is provided to give greater flexibility to the Ag9900 product range. Further information on using these inputs can be found in Section 5.6.

The Ag9900 must always supply a minimum current, see Table 10.3. When operated below this level the Ag9900 will emit a low level audible noise. The reason that the module emits this noise is due to the dc/dc converter running in discontinuous mode.
If this audible noise is not an issue, then the Ag9900 can work safely with a much smaller load. But to ensure that the PSE has a sufficient load to meet its Maintain Power Signature (MPS), it would be advisable not to operate the Ag9900 below the specified minimum load.

4.8 Additional Output Filtering

The Ag9900 as shown in Figure 5 offers the minimal capacitance the customer must fit, however Figure 6 shows two cost effective methods for reducing the ripple and noise, if required.

![Output Filter Diagram]

**Figure 6: Output Filtering**

The simplest and cheapest solution is shown in Figure 6 - Output Filter A. Taking the Ag9912M as an example, this will reduce the ripple and noise to typically 120mVp-p at maximum load. Adding a PI filter, as shown in Figure 6 – Output Filter B, will take the ripple and noise level down further to typically 25mVp-p.

4.9 Start-up Power

It is important that during start-up the Ag9900 input voltage is \( \geq 42V \), this will ensure that the module powers up correctly. Once the dc/dc converter is up and running the module will work normally even if the input voltage is reduced to its minimum level of 36V.

When using an IEEE802.3af compliant PSE this will not be an issue, as the minimum output voltage of the PSE must be \( \geq 44V \).
5. Typical Application

The Ag9900 can be used in numerous applications. In the example shown in Figure 7, the data outputs from the switch are connected to the inputs of a midspan. The midspan will then add power (to the data) on each output that supports Power over Ethernet (PoE).

In this example port 1 is connected to an Ethernet camera and port 2 is connected to a wireless access point, both of these devices have a built-in Ag9900. When the midspan is switched on (or when the device is connected), the midspan will check each output for a PoE signature. On ports 1 and 2 the Ag9900 will identify themselves as PoE enabled devices and the midspan will supply both data and power to these peripherals.

The other ports (shown in this example) will not have a PoE signature and the midspan will only pass the data through to these peripherals. The midspan will continuously monitor each output to see if a PoE enabled device has been added or removed.

![Diagram of typical application](image)

**Figure 7: Typical Application**

6. Operating Temperature Range

Because the Ag9900 is a power component, it will generate heat, so it is important that this be taken into consideration at the design stage.

The heart of the Ag9900 is a DC/DC converter, which like any other power supply will generate heat. The amount of heat generated by the module will depend on the load it is required to drive and the input voltage supplied by the PSE. The information shown within this section of datasheet is referenced to a nominal 48Vdc input voltage supplied by the PSE.
The Ag9900M has a maximum ambient operating temperature of 70°C with the Ag9900MT and Ag9900LP able to operate up to 85°C, see Figure 8-14. These results were performed in an environment chamber - Associated Environmental System SD-302, without any heat-sinking. The performance of the Ag9900M can be improved by forcing the airflow directly over the part or by using thermal relief pads (see Figure 15 and application note on thermal considerations for more information).

The output stage of the Ag9900M has no built-in thermal protection; however thermal protection is available with the Industrial temperature version Ag9900MT or Ag9900LP module. To prevent the module from being damaged it is recommended that the module be powered by an IEEE 802.3af compliant PSE or Midspan equipment. However the Ag9900 may be powered by a user designed power supply which should include thermal and over current protection and be current limited to 400mA.

![Figure 8: Ag9924M Operating Profile](image1)

![Figure 9: Ag9912M Operating Profile](image2)
Figure 10: Ag9905M Operating Profile

Figure 11: Ag9903M Operating Profile

Figure 12: Ag9912LP Operating Profile
Because each application is different, it is impossible to give fixed and absolute thermal recommendations. But due to the small size of this module, it is important that as much heat as possible is drawn away from it. It is also important that any enclosure used has sufficient ventilation for the Ag9900 and a direct airflow if possible.

One simple method for drawing some of the heat away from the Ag9900 is by means of power planes connected to the +VDC and -VDC pins of the Ag9900. This technique can be used to draw heat away from the DC/DC converter via the output pins.

These power planes must be on the outer layers of the PCB and the best results are achieved by having power planes on both sides of the main board with multiple through-hole connections. An example of this is shown in Figure 15 with an Ag9900M module.

Figure 13: Ag9905LP Operating Profile

Figure 14: Ag9903LP Operating Profile
Another method that we would recommend when using the Ag9900 series is the use of a thermal gap pad, such as Berquist ultra soft 0.1in, be placed underneath the Ag9900 PCB as shown below in Figure 16. The gap pad must fully cover the components on the bottom side of the PCB to provide the best possible thermal conduction through the pad to the customers PCB.
It is important to remember that the ESR of the external electrolytic capacitors will increase considerably when the ambient temperature falls below 0°C. If the Ag9900 is going to be used in applications where the ambient temperature can fall below 0°C, selection of appropriate output filter components must be done at the design stage.

7. Layout Consideration

Figure 17 shows the position of the isolation barrier, this area must be kept clear of tracks under the Ag9900 module.
8. Protection

8.1 Input Protection

The Ag9900 must be protected from over-voltages exceeding the 80V maximum rated surge input voltage. An inexpensive but effective solution can be achieved by connecting a Tranzorb diode across the input; see Figure 18.

More information is available in Apps Note “ANX-POE-Protection”.

Figure 17: Layout Consideration

Figure 18: Ag9900 Input Protection

Note: The keep out area is on the top layer of the mother-board under the module.
8.2 Thermal Protection

The standard Ag9900M does not have built-in thermal protection. If this module is intended to be used in high ambient temperatures >50°C then we would recommend either the Industrial temperature version Ag9900MT or the Ag9900LP (both include thermal protection) to be used.

The thermal protection reduces the output power, see figures 8 to 14, to ensure that the maximum component temperature is not exceeded. Full output power will be restored when the ambient temperature drops back down into the safe operating range.

9. EMC

The Ag9900 uses a dc/dc converter with pulse width modulation, so care does need to be taken to minimise emissions.

The Ag9900 is designed to meet EN55022 Class B (pre-compliance test results are available from Silvertel) however, because the Ag9900 will only be one component within your system, it is impossible to say whether the final product will pass EMC testing without the need for additional filtering. Figure 19 shows our recommended EMC Filter configuration for the Ag9900. For more information, tips and suggestions refer to the application note “ANX-POE-EMI” on our website.

Note 1: Typical figures are at 25°C with a nominal 48V supply and are for design aid only. Not Guaranteed.
2: Measured with external filter A. The output ripple and noise can be reduced further with external filter B, see Section 5.8.
3: The module can emit an audible noise, if operated at less than the specified minimum I<sub>LOAD</sub> and cause the PSE to fail its MPS.
4: Electrical characteristics are identical for the Ag9900M and Ag9900MT variants.
5: The Ag9912 output must not exceed 12W.
6: >200mohm short due to thermal limitation.
